

# NATOLI

## Consulting Limited

### NATOLI optiADMIN

Live Monitoring, daily checks and performance information, all from one console....

## PROBLEM

HP CA processes such as daily checks, continual assessment and scheduled performance reviews are often dropped due to the need to address immediate business requirements. optiADMIN automates these processes, giving clear visual information and reporting for the HP CA Stakeholders.

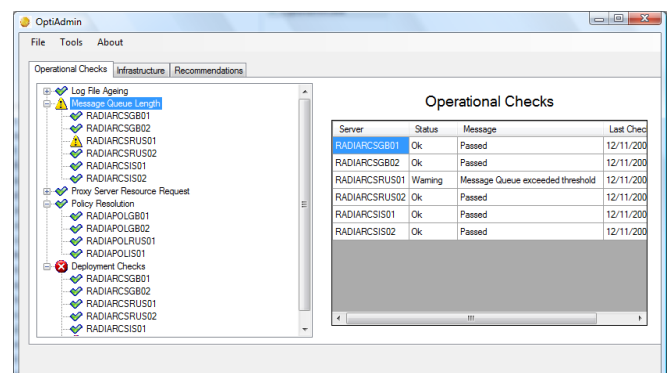

optiADMIN supplies administrators and managers with real time information, infrastructure checks and performance information necessary to have confidence in your Configuration Management System. Visual information from a single console allows management and administrators to immediately see answers to the following types of question:

- Did all scheduled tasks complete
- Is every server operational
- Are there any overdue maintenance tasks affecting performance
- How many machines have been notified
- Are packages currently being deployed
- Is reporting up to date
- Are any applications constantly being repaired
- Is policy managing the intended applications

## WHAT IS IT?

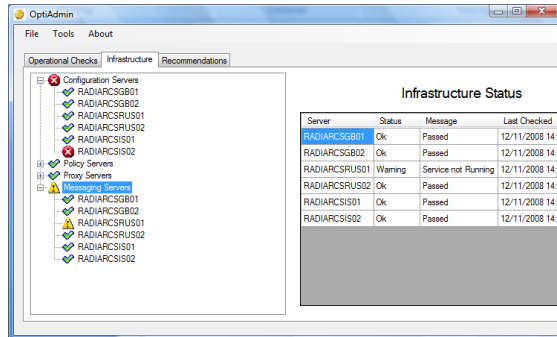

NATOLI's optiADMIN software console gives visual information on daily checks, operational performance and administrative tasks through a single console. The console identifies warnings as well as critical errors, giving fault finding identification and suggestions.

- Policy Resolution
- Proxy operational checks
- Package deployment checks
- Policy assignment validation
- Log file maintenance
- Messaging server queues
- Server synchronisation
- Proxy preloads
- Response times
- Server performance monitoring
- Repeated application fix
- Enhanced reporting server information
- Orphaned services

## WHAT DO WE GET?

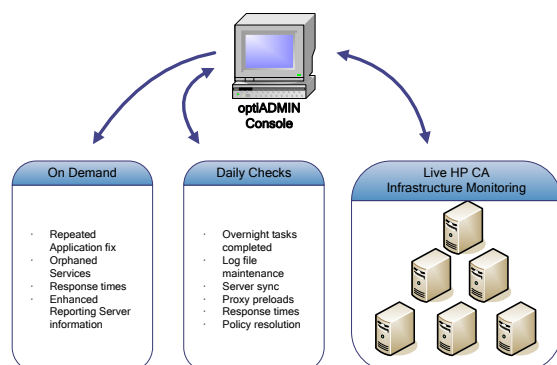

optiADMIN uses a multi tab presentation console, giving drillable visual information on processes or infrastructure.

License purchase includes configuration for your enterprise plus implementation and Go Live support, your HP CA administrators will be trained in the use of the product by a NATOLI consultant. One management presentation is included, allowing your stakeholders to discuss and understand the process implications and benefits of OptiADMIN within your environment.

## THE TECHNICAL BIT

optiADMIN is written in a modular form, allowing unusual client reporting and monitoring requirements to be added via bespoke tabs to the main console view. NATOLI can quote for these modular additions to the overall product functionality on a case by case basis.

## optiCONNECT

The benefits of optiADMIN can be further enhanced by performance improvements from optiCONNECT. Using multiple data sources to identify target machines for notification, the Notify engine monitors the HP CA infrastructure and ensures that the maximum estate is notified in the minimum time. In addition administrators gain an ability to pause and restart notifications without disrupting the deployment infrastructure.

Combined with Wake on LAN optiCONNECT gives business the ability to deploy at maximum efficiency to switched off machines, allowing the enforcement of energy saving policies. Where overnight deployments are not available, optiCONNECT is able to notify machines during the working day without loss of focus for users.
