Consulting Limited

NATOLI optiCONNECT

Maximum performance, minimise deployment times and save energy....

PROBLEM

Your business needs to distribute, remove, update or patch software and OS as quickly as possible, with maximum coverage. Historically systems of timers and login scripts are not flexible enough to meet immediate business needs. Typical issues found are:

- Business needs are more immediate than current deployment methods allow
- Client rejections at peak loads
- Inflexible deployment windows
- Under utilised infrastructure
- No simple means of pausing rollouts if issues found
- Increased complexity and delays when Patch and Audit notifications have to be factored into the notification schedules
- Changes to deployment windows take time to rollout
- Change Configuration Management teams are seen as "we can't because..." instead of "we can"

NATOLI optiCONNECT optimizes the performance of your HP CA Infrastructure, giving maximum notifications in the minimum time, giving the flexibility to meet your business needs.

WHAT IS IT?

NATOLI's optiCONNECT software controls and enhances the HP CAE Notification process giving the following benefits:

- Maximizes the notification performance of your HP CA infrastructure for Software and Patch management
- Allows immediate rollouts for emergency releases
- Notifies machines at maximum operational efficiency without overloading the infrastructure
- Maintains a fluid and dynamic list of active users or machines from various data sources
- Allows a 'no notifications' list for excluded or manually notified hardware
- Cycles notification list to ensure maximum number of machines or users notified
- Gives a simple one click means of pausing or restarting the notification process across the entire estate
- Utilises Wake on LAN to enforce energy saving policies
- Provides an audit/reporting capability for notification progress
- Notify during the working day if required with minimal user impact

WHAT DO WE GET?

optiCONNECT allows you to meet your business needs, giving the ability to react, at maximum performance, when necessary. In addition you minimise your infrastructure requirements, and maximise your benefit from configuration management.

Controlled through a simple user interface, your HP CA administrators will be trained in the use of the product by a NATOLI consultant.

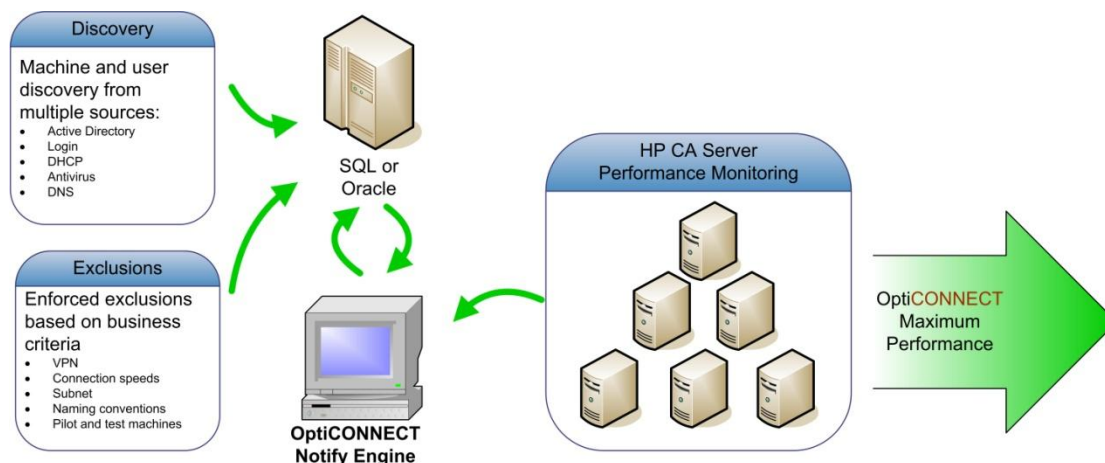

License purchase includes configuration and implementation for your enterprise and Go Live support. One management presentation is included, allowing your stakeholders to discuss and understand the process implications and benefits of optiCONNECT within your environment.

THE TECHNICAL BIT

optiCONNECT collects machine and user data from multiple sources, automatically identifying machines for notification. Live monitoring of the HP CA infrastructure allows the Notify Engine to operate your infrastructure at peak performance, giving maximum notification capability.

Exception lists (AD or other sources) ensure that machines can be excluded from the notify processes.

Notifications can be paused if issues are identified with rollouts, and restarted at the click of a button. Different notification types (patch, audit, software, single service) can be selected as required.

optiCONNECT Performance

Following implementation, optiCONNECT can run your HP CA infrastructure at its maximum capacity, with no client 'kickbacks', for as long as required. Capacity depends upon server and network specifications, however OptiCONNECT maximises the available performance from the minimum required hardware.

optiADMIN

The benefits of optiCONNECT can be further enhanced by the monitoring and reporting capabilities of optiADMIN. Automated daily and live checks, on-demand and general performance monitoring information is supplied in a simple to present format through a graphical user interface.
